DIAGNOSTIC WAX UP CHECK LIST

To help us serve you better, we have put together a check list of the items needed to complete a diagnostic wax up. These diagnostic tools should be obtained during the diagnostic appointment a couple of weeks before the prepping appointment.

1. Photos of pre-op teeth including: Eyebrow to chin natural smile, eyebrow to chin retracted, 1:2 retracted, profile of natural smile.
2. Impression of upper and lower pre-op. Gum tissue is as important as the margin of a restoration.
3. Bite registration including CR/CO bites.
4. Stick bite (horizontal plane parallel to horizon line).
5. Detailed lab slip, expressing goals of patient.
6. Indicate the desired length of final restorations.
7. New vertical measurements from CEJ to CEJ.

HERE ARE A COUPLE OF HINTS WHEN SENDING A CASE:

1. Don't send models. Send polyvinyls.
2. Label all sides and photos with the doctor's name and patient's name.
3. Make sure the models and transfer jigs are securely packed. If the transfer jig moves, it becomes useless.

This check list is necessary to help us serve you and your patients better.
